

make your case...

with a solid terrain model

SOLID TERRAIN MODELING, INC.

jurors relate better to physical models

A Solid Terrain Model is the best way to clearly and simply illustrate topographic information. Models can help you capture and hold the attention of your audience while you make yourself understood. Computer models can be difficult to interact with and not everyone feels comfortable that they understand what they are seeing. The presence of a solid model during a hearing or trial is a constant reminder to everyone that you are knowledgeable and prepared with easy to understand exhibits that will give everyone the confidence to reach an informed decision.

Accuracy, realism & a fast turn around

STM invented a new automated process to make models and the results are unlike anything you have seen before. A full color aerial picture is printed directly onto a precisely machined surface giving the best possible representation of terrain. Text, lines, arrows, any graphical element can be added to the image to aid in the presentation. These models are durable, touchable and can be produced in days, not months.

Our models have been presented at the World Court in The Hague, US Federal Court, as well as Los Angeles Superior Court and various municipal courts. We understand how critical your court date is and will move mountains to get you what you need when you need it.

We also offer the addition of finely crafted custom architectural features when needed.
